PROJECT DESCRIPTION   :

1. I want to create a Smart Donation Matcher using only AI tools and no coding.
2. The system should connect donors with charities based on real needs.
3. Use AI tools like ChatGPT, Airtable AI, Zapier AI, Notion AI, Glide AI, or Make.com.
4. Create two AI-assisted forms: one for charity needs and one for donor offers.
5. The charity form should list items needed, quantities, and urgency.
6. The donor form should list items offered, conditions, and location.
7. AI should compare both forms to find the best match automatically.
8. Include a clear AI prompt that performs the matching logic.
9. AI must generate a message for the donor explaining where to donate.
10. AI must generate a message for the charity notifying what is coming.
11. Build a simple dashboard using only no-code AI tools.
12. Explain step-by-step how to set up the entire system with these tools.
13. Keep instructions simple enough for a complete beginner.
14. Include example templates for the forms and messages.
15. Provide a final workflow summary showing how the data moves through the data moves through the system.
